

Gully Stars — build the full platform

A mobile web platform for grassroots sports teams. Equal parts sports management and social. Players are the core audience. Three sports: cricket, football, basketball. Build as much as you can. Ship something real.

Mobile web · 390px viewport · 3 sports · AI tools expected

CONTEXT

Grassroots sports teams have no good home. WhatsApp for training, spreadsheets for fixtures, nothing for memories. **Gully Stars** fixes that — a platform where captains manage squads, organisers run tournaments, players track their game, and fans follow along. You're building the first version from scratch.

FOUR USER ROLES

Player Joins a team, confirms training and match availability, tracks personal stats.	Captain Manages roster, schedules training, reports scores, posts game content.	Organiser Verified role. Creates tournaments, manages brackets, approves teams.	Fan Follows teams and leagues, reacts to posts. No team access needed.
---	---	---	--

WHAT TO BUILD

Must Team management Registration, public or invite-only visibility. Player roster with join requests. Captain assignable.	Must Social feed Captains post photos and short videos from games. Players and fans react. Feed scoped to followed teams. <i>This is the hardest feature. Scope it carefully.</i>
Must Training sessions Captain creates session with date, time, location. Players respond: Going / Not going / Maybe. Captain sees live count.	Must Match RSVP & results Players confirm availability. Captain submits score. Result auto-updates league standings.

Must Tournaments Organisers create tournaments. Round-robin or bracket. Clean fixtures schedule. Live standings from results. Teams apply, organiser approves.	Must Player stats Sport-specific stats per player. Goals (football), wickets (cricket), points (basketball). Shown on profile.
Bonus Follow & notifications Follow teams and leagues. In-app notifications for results, training reminders, new posts.	Bonus Public league page Shareable URL per league. No login required. Fixtures, standings, recent results.

KEY SCREENS

Home feed · Team profile · Training session · Match detail · Tournament bracket · Player profile + stats · Onboarding / role selection

SPORTS IN SCOPE

Cricket · Football · Basketball

LOCAL DEV SETUP

Your README must include a setup section that lets anyone clone and run the full platform locally in under 5 minutes. It should cover all of the following:

- Prerequisites — Node/Python version, package manager, any required tools
- Environment setup — how to configure .env or any local config (include a .env.example)
- Install — single command to install all dependencies
- Database — how to run migrations or seed data so the app has something to show
- Run — single command to start the full stack locally
- Default accounts — at least one seeded user per role (player, captain, organiser, fan) with credentials listed

Demo requirement. Record a 2–3 minute screen recording of the platform running on your local machine. Click through the core features: onboarding, team creation, training session, match RSVP, score submission, and tournament standings. No voiceover needed — just show it working.

RULES

- Mobile web — design for a 390px viewport.

- Stack is your choice. Justify it briefly in your README.
- AI tools are not just allowed — how you use them is part of what we evaluate.
- It must run. Live link or clean local setup. Broken repos don't count.
- Mock auth is fine. No need for real OAuth or SMS.
- Scope wisely. A working core beats five half-built features.
- If you feel like naming it, go ahead.

WHAT TO SEND

- 1 GitHub repo (public or invite)
- 2 Working local dev setup — we must be able to run it in under 5 minutes
- 3 A short screen recording (2–3 min) demoing the platform running locally, clicking through the key features
- 4 README — decisions, tradeoffs, what's next
- 5 2–3 sentences on how you used AI in the build
